

Neuroendocrine Tumor InnOvation Fund

Neuroendocrine tumors are rare, slow-growing, hormone-producing tumors that affect neuroendocrine cells present throughout the nervous and endocrine systems. Most of the time these tumors are difficult to detect and diagnosis can be delayed for years. Once diagnosed, patients face numerous barriers for care as there remains much to be learned about these rare tumors.

The Neuroendocrine Tumor Innovation Fund was established to help support the purchase of novel equipment, the development of new radio-therapeutics and other new treatment options at the Neuroendocrine Tumor Clinic at Ochsner Medical Center - Kenner. This fund will also support educational programs that would help to raise awareness and educate physicians and the general public about these rare tumors and treatment options.
